**ELECTROSWITCH • SWITCHES & RELAYS**  
UNIT OF ELECTRO SWITCH CORP.

## About Electroswitch ...

Electroswitch is an acknowledged leader in the electrical industry. Over 45 years of experience goes into the design and manufacturing of our quality rotary power switches. The application of these switches for control of complex power systems through centralized switchboards and panels has been our speciality in the industrial, electrical utility and military fields.

In addition to being the first choice of electrical utilities, Electroswitch rotary power switches and relays are specified by manufacturers of high quality heavy-duty control systems. These range from hi-shock Naval ship-board and nuclear reactor control to rugged industrial equipment such as locomotives, tractors and other high vibration and hi-shock applications. Their durability and reliability have proved to be the most economical solutions for our customers' most taxing applications. The dependability of our switches is the result of sound design, careful manufacturing and rigid quality control. When a product line is as specialized and as critical in application as ours, we have to do the job right the first time ... and every time ... to support our customers' demands for the highest quality and reliability.

The ability to custom design rotary power switches to precisely fit every application has taken Electroswitch into many unique applications. The opportunity to choose among the distinct families of rotary power switches (Detent and Snap-action) assures our customers that the correct switch is used for their most critical needs.

Economy is inherent in the design of all our rotary power switches. The modular constructions permit literally millions of different rugged and reliable switches to be built from an inventory of a few basic parts. Our use of the latest manufacturing techniques and methods also assures a reliable product ... at lower cost. Equally as important to our customers, Electroswitch traditionally exceeds standards for on-time, prompt deliveries.

Our test laboratory includes the equipment necessary for most endurance and environmental testing and quality assurance. Testing is performed to meet the requirements of UL 1054, UL 508, CSA 22.2, ANSI/IEEE 323, MIL-S-6807, MIL-S-21604, MIL-S-15291 and many other customer, industry and military specifications.

### **WARRANTY**

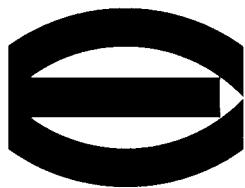

All products and components manufactured by Electroswitch are warranted for a period of one year after date of shipment. All products manufactured by Electroswitch require special tools and fixtures to assure reliable operation of these products. Our ratings, both electrical and mechanical, are maintained only through extensive testing after proper assembly. The independent approvals such as UL, CSA and various Military Agencies, can only be maintained with complete control over the manufacture of these products. It is the policy of Electroswitch not to sell any internal spare parts. Any field dis-assembly will automatically void the Warranty of the product and Electroswitch will assume no liability for any damage as a result of dis-assembly.

# ROTARY MULTIPOLE AND SELECTOR SWITCHES

## Details of Construction

### Electroswitch Detent Switches

are heavy-duty switches of a very versatile design that enables standard units to satisfy a great variety of complex switching applications. They are modular in design whereby several subassemblies are stacked together to form a rigid device. Figure 1 shows a cut-away view exposing the basic components.

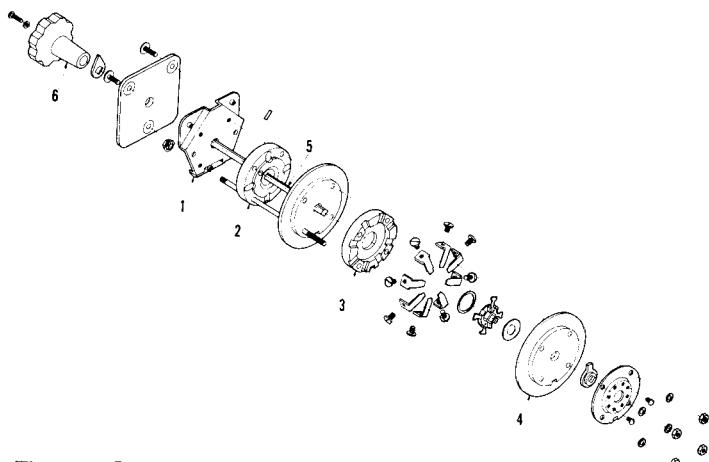

Fig. 1. Cutaway view of a detent switch

The mounting plate (1) connects a detent assembly (2) to one or more contact decks (3) and finally a position limiting stop plate (4). These assemblies are bolted together along with a steel shaft (5) and a handle (6).

### The Electrical Design

The Detent Switch contacts operate on the original, reliable principle of knife switches — double-sided, double-wiping, spring-wiper blades closing on both sides of a terminal. This design is shock-proof and virtually bounce-proof. Figure 2 shows a typical contacting arrangement.

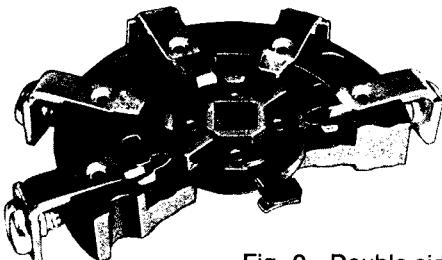

Fig. 2 Double-sided, double-wiping knife-type contact configuration

### The Detent Assembly

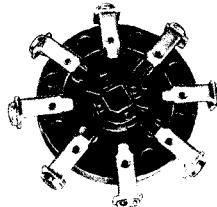

The detent assembly contains a specially designed star-wheel and up to four spring-loaded ball bearings providing clean, positive indexing. Spring-return switches use a coil spring in place of the star-wheel/spring/ball bearing arrangement.

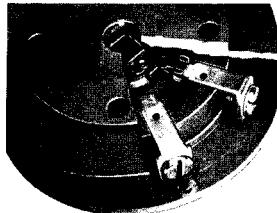

### Details of Construction

#### The Contact Deck Assembly

The electrical parts are contained within sturdy glass alkyd moldings that provide individual insulated compartments where all switching takes place.

An insulating barrier completes the contact deck assembly. The barrier not only separates one contact assembly from another but also provides a tight insulating compartment.

Positive reliable maintenance free operation results from the double-sided, double-wiping, self-cleaning knife-blade moveable contacts.

The barrier next to the stationary terminals is clearly marked with letters for Style SJL, SJR, SJM and SJK and numerals for Series 24G, that correspond with the wiring diagrams. The type AF is marked numerically on the decks.

Terminal screws secure the external wiring to the terminals.

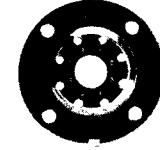

Jumpering may be done right on the switch providing a simple and neat arrangement. Silver-plated brass strap jumpers are available for adjacent contacts — either between adjacent contacts on the same deck or the same terminal location on adjacent decks. Wire and lug jumpers are also available. Jumpers are already supplied assembled on the typical instrument switches.

#### The Stop Plate

The steel stop plate assembly includes a steel stop arm that is connected to the shaft and a steel stop plate that contains tapped holes. Stop screws are inserted in the field to limit the positions to the number and location desired. This externally adjustable position limiting feature allows the use of standard switches for many customized applications. The limit screws are supplied unassembled, except Series 24G, Instrument and Control Switches.

## FEATURES

- Time proven double wiping contacts for low contact resistance even under extreme shock and vibration conditions.
  - All making and breaking of contacts take place in the fully enclosed decks.
  - Versatile - many special designs are available.
  - Available in industrial versions. See Catalog IND-1.

## **OPTIONS AVAILABLE**

In addition to the standard units manufactured to the specified MIL-SPECS, we can furnish a wide variety of optional equipment, all manufactured in strict accordance with the latest quality control standards.

Among the available options are:

- flush, shank, pistol grip and round knurled handles
  - engraved rotary dials • escutcheon plates (plain or engraved) • make before break contacts • combinations of contact assemblies • special panel thickness • spring return contacts.

# CLASS SR SNAP SWITCHES

## Details of Construction

### The design principle

that enables us to combine a relatively small number of basic parts to satisfy a wide variety of requirements for selector and control switching in power circuits is shown by this exploded view. Standard switches built on this principle, in 1SR, 3SR, 6SR, and 20SR ampere capacity, are listed in this section. The catalogued units merely indicate standard switching possibilities; we will gladly recommend other combinations, based on our experience, for specific requirements.

### The electrical system

of the SR switch comprises two or more stationary contacts (9) and one or more sets of movable contacts. These are pairs of spring-metal blades (8) that make high-pressure, low-resistance contact on both faces of the stationary contacts while bridging two or more of these contacts. The stationary contacts fit in radial grooves (12) in the rim of molded insulating disks (7) within which the movable contacts are carried on an insulated shaft (11). All making and breaking of electric circuits takes place within the closed spaces between adjacent disks. Their quick-break action makes these switches particularly suitable for direct-current service. The ends of the stationary contacts extend outside the insulating disks and serve as connecting terminals (10). This one-piece contact/terminal construction minimizes series resistance and heating. Depending on current rating and on wiring requirements, the terminals may have tapped holes for connecting-screws or clearance holes for bolt-connection of cable-lugs.

### The mechanical system

of the SR Switch is designed to provide uniform high-speed make and break, regardless of whether the operating handle (1) is turned rapidly or slowly. Turning the handle through about 120° in either direction winds a powerful coil spring (3). When this is fully wound, the indexing plate (4) is momentarily withdrawn from the locking plate (5) by an eccentric cam. The drive-shaft and movable contacts then snap rapidly to the next position, where the indexing plate holds them until the spring-drive mechanism is again operated. Transit time is about ten milliseconds.

### Assembly

The snap-drive mechanism, mechanism-cover (2), locking plate, mounting bracket (6), insulating disks, and back plate (14) are stacked on side securing rods (13) and bolted firmly together to form a rigid assembly. The handle is keyed to the operating shaft and secured by a screw.

### STATIONARY CONTACTS

Non-shorting (break-before-make) contacts are standard in all the ratings and circuits shown in this section.

Shorting (make-before-break) contacts, required in some special circuits, are available on order.

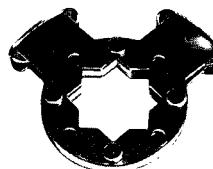

The "Sweep" contact maintains the connection with the rotor through consecutive positions.

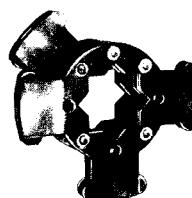

### MOVABLE CONTACTS (rotors)

The simple, straight-across rotor bridges stationary contacts in the same insulating disk. It provides single-throw switching in Circuit 1 and double-throw switching in Circuit 6.

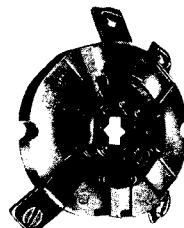

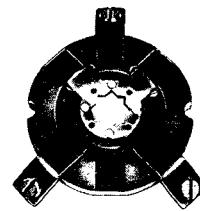

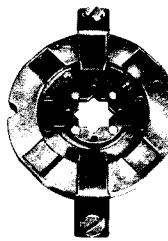

The right-angle-blade rotor provides a double-throw switching, with an intermediate OFF position, in Circuit 7.

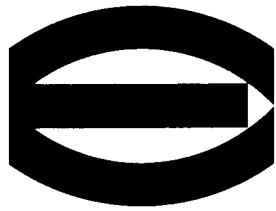

A multi-fingered blade is combined with a single-contact blade to form a composite (double-deck) rotor that interconnects stationary contacts in adjacent disks. Suitable blade arrangements provide double-throw, triple-throw, or four-throw switching.

### INSULATING DISKS (and circuits)

The insulating disks, molded of glass alkyd per MIL-M-14, have three functions. They hold the stationary contacts; they form enclosures that contain all making and breaking contacts; and they provide both mechanical and electrical separation of switching sections. Typical circuits with corresponding schematic diagrams, are shown above.

## FEATURES

- Time proven double wiping contact for low contact resistance even under extreme shock and vibration conditions.
- Switching speed not dependant on operator action.
- Quick make and break action. Approximately ten millisecond contact transfer time.
- Excellent for DC as well as AC switching.
- All making and breaking of contact takes place in the fully enclosed decks.
- Versatile - many special designs are available to fit every application.
- Available in commercial versions. See Catalog IND-1.

## OPTIONS AVAILABLE

In addition to the standard units manufactured to the specified MIL-SPECS, we can furnish a wide variety of optional equipment, all manufactured in strict accordance with the latest quality control standards. Among the available options are: escutcheon plates (plain or engraved), silver-plated contacts, combinations of contact schematics, spring-return action (momentary contacts), make-before-break (shorting) contacts, special panel-thicknesses, other handles and 2- or 3-position limited rotation.

## How to Order

(111) — NavSea Type Code\*  
 Class 1SR Switch 121 7 05 AA - 3  
 Number of Poles Circuit  
 Variation code AA  
 Positions (if applicable)

### Variation Codes:

**AA** - Panel clearance is .44 from mounting surface to bottom of handle to allow for seal bushing for panels up to .187 thick maximum.

- Oval flush handle.

**LA,LB, etc.** - Factory will assign upon receipt for any deviation from standards.

### Positions:

All snap switches with variation code may be factory limited to 2 or 3 positions. All other standards are supplied unlimited.

### Number of Poles:

Circuits 2, 3, and 4 require 2 decks per pole. All other circuits are 1 deck per pole.

### 111 Series

\*For replacement only, superseded in new designs by 121 Series

## MIL-S-15291

### General Specifications

<b>Index Angle of Throw</b>	90 degrees snap action
<b>Contact Material</b>	Moveable: Phosphor Bronze Stationary: Copper
<b>Insulation (Spacers and Decks)</b>	Glass Alkyd, MAI-60 in accordance with MIL-M-14
<b>Stop Strength</b>	100 inch pounds
<b>Insulation Resistance</b>	200 megohms minimum
<b>Contact Resistance</b>	.01 ohms maximum
<b>Dielectric Strength</b>	2000 vrms
<b>Temperature Rise</b>	50 °C
<b>Electrical Endurance **</b>	20,000 operations 15,000 operations
30 amps @ 500 volts A.C. 30 amps @ 250 volts D.C.	

\*\* Endurance values given are based on Group B and Group C Test specifications, extended ratings available by contacting factory.

### Applicable Test Specifications

<b>Mil-Std-105</b>	Sampling Procedures and Tables for Inspection by Attributes
<b>Mil-Std-167-1</b>	Mechanical Vibrations of Shipboard Equipment (Type I - Environmental and Type II - Internally Excited)
<b>Mil-Std-202</b>	Test Methods for Electronic and Electric Component Parts
<b>Mil-Std-454</b>	Standard General Requirements for Electronic Equipment
<b>Mil-S-901</b>	Shock Tests, H.I. (High Impact): Shipboard Machinery, Equip. and Systems

### How to Order

(113) — NavSea Type Code\*

Class 3SR Switch	123 7 05 AA - 3
Number of Poles	Circuit
Variation code	
Positions (if applicable)	

#### Variation Codes:

**AA** - Panel clearance is .44 from mounting surface to bottom of handle to allow for seal bushing for panels up to .187 thick maximum.

- Oval flush handle.

**LA,LB, etc.** - Factory will assign upon receipt for any deviation from standards.

#### Positions:

All snap switches when part number is suffixed by the AA variation code can be ordered limited to the number of positions desired. Numerical sequence can only be -2 or -3. All other standards are supplied unlimited.

#### Number of Poles:

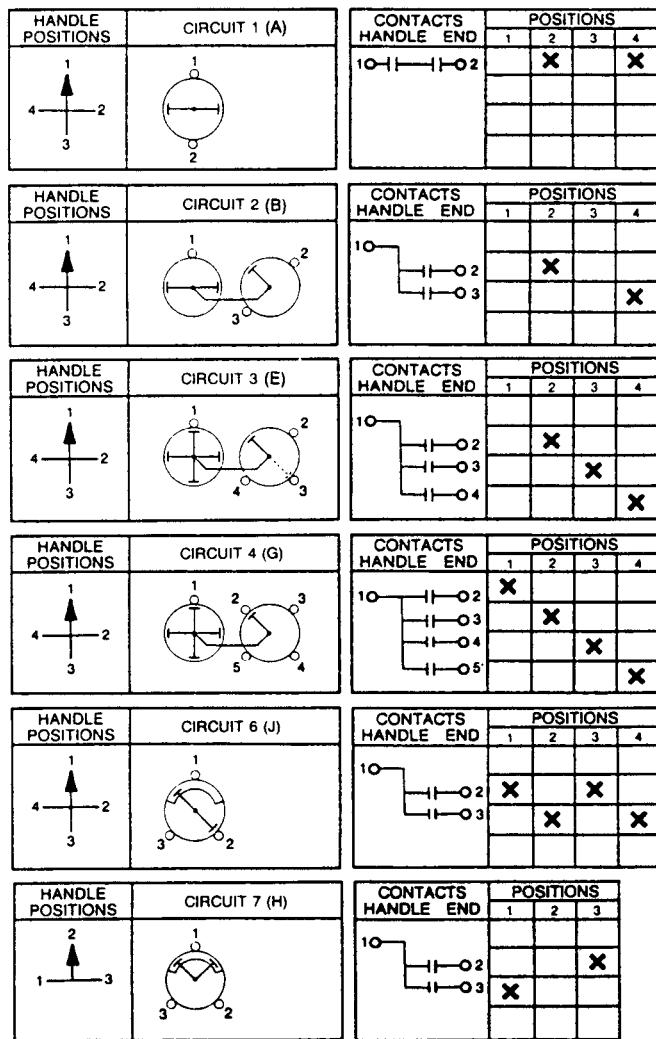

Circuits 2, 3, and 4 require two decks per pole.  
All other circuits are one deck per pole.

113

\*Use in all new or existing applications,  
superseded by 123 Series in applications  
where space is adequate.

### Standard Circuits

NAVSEA switching characteristic in parenthesis

Alternate shown as dotted line is 3 position double break switching ON 1, ON 2, ON 3.

Handle positions will be 1    2    3

For Circuit (C) and (F) Contact Factory

***QPL***

## **What is QPL...and how to use it**

Electroswitch builds Military Products which appear on the following Qualified Products Listing

**M6807, MS21994, MS21995, MS25002, MS90547**

M21604 /1,/2,/3,/4,/5,/6,/7

**M15291** /1,/2,/3,/4,/5,/6,/7,/8,/9,/10,/11,/12,/13

The above QPL listings have been compiled into the QPL section of this catalog.

Using the Military Dash Number or (Navy Type number) the Electroswitch catalog number can be identified, i.e.

**MS25002-3**      Electroswitch catalog number 32303

S3JR10 Electroswitch catalog number 23310G

**MS15291/11-003 or 20SR2B1** Electroswitch catalog number 117202LB

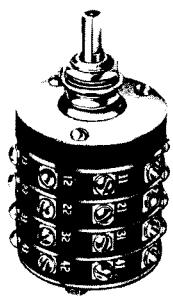

**Remember...**Many variations of products that are not listed on the QPL List comply with MIL-SPECS requirements.

## HANDLES

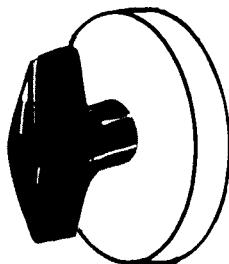

### STYLE SJR, SJM, SJK

Handle "G" is standard for Style SJR, SJM. Oval Flush "A" handle is standard for SJK.

**ALL HANDLES IN THIS ROW ARE INTERCHANGEABLE.**

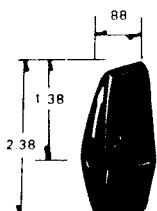

Except with grey dial which requires .5" longer shaft.

OVAL SHANK (G)  
with gray dial

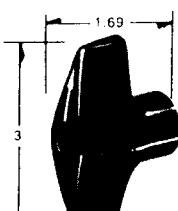

Handle 02000-3-1  
Dial 02001-1B

OVAL FLUSH (A)  
with white arrow

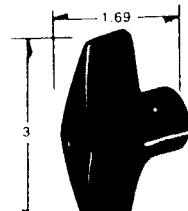

02000-1

OVAL SHANK (C)  
with white arrow

02000-4-1

OVAL SHANK  
without arrow

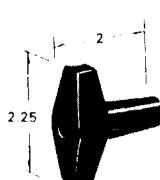

02000-3-1

### SERIES 24G

Handle "G" is standard.

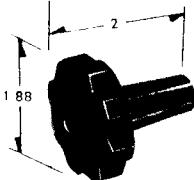

**ALL HANDLES IN THIS ROW ARE INTERCHANGEABLE.**

OVAL SHANK (G)

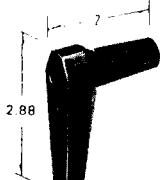

02000-11B

KNURLED (H)

02000-10B

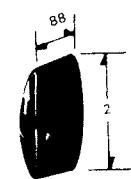

PISTOL GRIP (J)

02000-12B

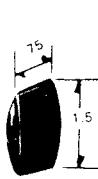

### STYLE SJL

OVAL FLUSH  
Standard 2"

01040-11

OVAL FLUSH  
1.5"

01040-3

### TYPE AF

SINGLE HOLE 03029-1

# OPTIONS and SPECIAL CONSTRUCTIONS

## Extra-long switches

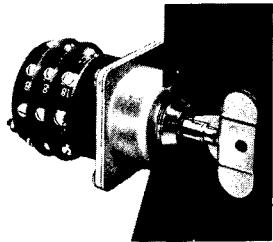

Switches having many more poles than cataloged units can be built with standard parts.

*Contact factory.*

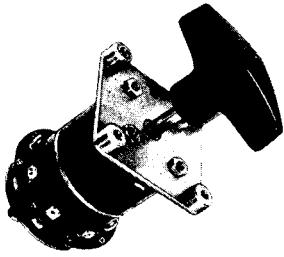

## Key operation

Handle of switch can be locked in any or all positions by removable key; prevents unauthorized operation.

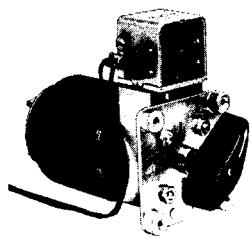

## Push-to-turn operation

Switch-handle can be turned only while it is pushed toward panel. Interrupter contacts in push mechanism permit "dead-circuit" operation.

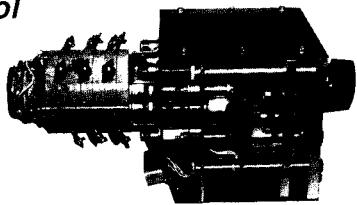

## Solenoid lock

Prevents operation of switch unless solenoid is energized; provides safety interlock action.

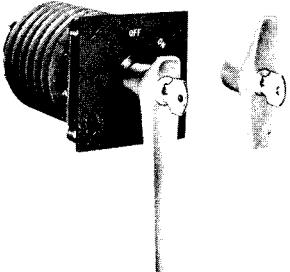

## Motorized Snap Switches for Computer Control

Remote (motor driven) two, three and four position rotary type, snap action power switches.

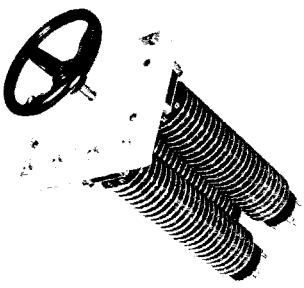

## Key-locking switch

Up to 75 poles; can be locked in all positions or in any factory-set combination of positions.

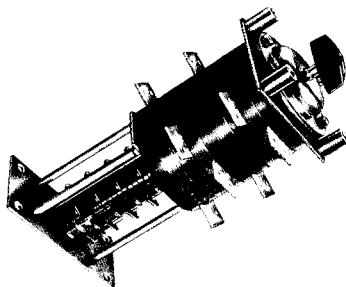

## Ganged switches

Geared drive-mechanisms provide single-handle control for hundreds of circuits at once. Built to your requirements for load and circuit arrangements.

## Tandem switches

200-ampere and 30-ampere multipole switches with common drive-shaft; other special combinations to suit your need.
